Introduction: This project presents a lightweight AI-powered chatbot system using an open-source Large Language Model (LLM). It integrates authentication, chatbot interaction, and persistent chat storage into a single workflow.

Implementation:

The system is implemented using modern web development and backend technologies. The backend handles authentication, model communication, and database operations, while the frontend provides an interactive chat interface.

- User authentication is implemented using secure login mechanisms.
- The chatbot communicates with the LLM through an API or local model integration.
- Chat history is stored in a database, ensuring data persistence across sessions.
- Each user's conversation is uniquely maintained and retrieved upon login.

Features:

- Secure login-based access
- AI-generated responses using an LLM
- Real-time chat interaction
- Persistent, user-specific chat history
- Seamless user experience across sessions

Conclusion: The project demonstrates practical integration of AI with full-stack development, ensuring secure user handling and persistent conversational experience.
